

InterGlobe Aviation

Operating forecast and valuation | Keyur Marolia | Saved model summary

Valuation basis: 31 March 2026. Market comparison: 7 September 2026.

Research question

Does capacity growth and operating recovery translate into cash flow after fleet investment and lease obligations? The Excel model links airline operating drivers to forecasts, unlevered cash flow, DCF and reverse DCF.

Source: saved workbook, 11_DCF | WACC 11.1968%; terminal growth 4.0% | Equity value is floored at zero

Saved model output

Result

FY2026 actual / FY2031 forecast revenue	INR 84,961.9 / 153,031.2 crore
FY2031 forecast unlevered cash flow	INR 3,839.6 crore
WACC / terminal growth	11.1968% / 4.0%
Enterprise value / lease-adjusted net debt	INR 39,306.7 / 41,532.9 crore
Unfloored equity residual / floored value per share	INR (2,226.2) crore / INR 0.00

Interpretation and sensitivities

Enterprise value falls below lease-adjusted net debt under the saved assumptions, producing a zero equity floor. This is a simplified model outcome, not a claim that the traded shares have no economic value. Approximately 83.0% of enterprise value comes from discounted terminal value. WACC, terminal growth and fleet reinvestment therefore require close attention.

The FY2027 bear/base/bull comparison flexes operating assumptions separately from DCF sensitivity. The September market price is not a September valuation roll-forward. The forecast contains operating and supporting schedules, rather than a complete three-statement forecast.

Model boundaries and source trail

DCF excludes other income from operating profit, treats lease liabilities as debt, and estimates reinvestment from depreciation and changes in net PPE and right-of-use assets. Historical and forecast UFCF use different reinvestment conventions. These assumptions materially constrain valuation interpretation.
